My name is Hirwa Honorine.

Identity and concept

Individual portfolio app • Mobile Application Development SWE 3409

STUDENT IDENTITY

Full name: Hirwa Honorine Registration number: 25/28159
App name: HirwaPortfolio Verification code: MOB-A2-8159
Institution: INES-Ruhengeri • Programme: Computer Science / Software Engineering

Professional headline

Aspiring Software Developer | Web Development & AI Enthusiast

Short biography

I am a Computer Science student at INES-Ruhengeri who enjoys turning ideas into simple websites. I have worked on Agri Market and Mwiza Kids Wear, and I am continuing to improve my web development skills. I also use AI tools to support my work, then review and edit the results.

Purpose and audience

This app introduces me to a recruiter or reviewer considering me for an internship or first professional opportunity. It presents my current skills, education, project work and a profile I can edit on my phone.

Visual direction

I use deep navy (#172B4D), blue (#356AE6), a light blue-grey background (#F5F7FC), white cards and dark text. The aim is a calm, readable interface with clear labels, comfortable spacing and straightforward navigation.

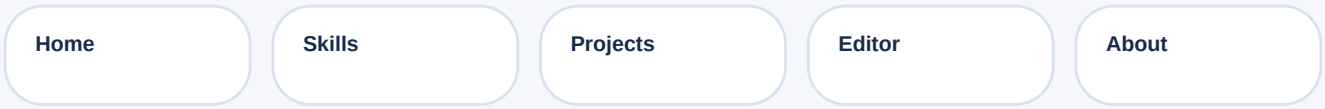
Personalization

The project examples describe my own ideas and the work I have actually done. Agri Market is described as a working website with a connected MySQL database; Mwiza Kids Wear remains a prototype and its MySQL connection is still planned. Intended features are not presented as verified features.

User flow and information architecture

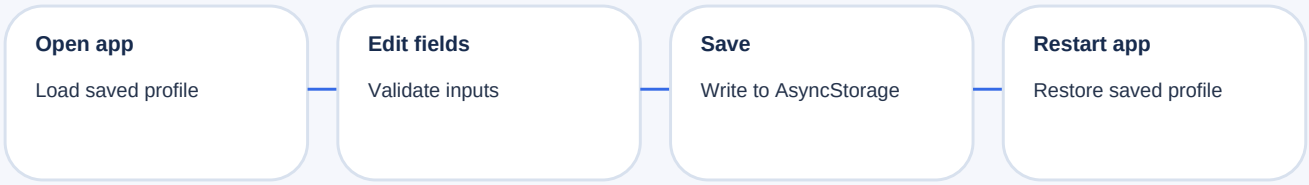
Navigation, editing, media and saved-state paths

Main navigation: bottom tabs



Nested stack inside Projects tab

Profile edit and persistence flow



Media flow

Editor → request camera or gallery permission → capture/select or cancel → preview image → replace/remove image → save profile → restart app to verify persistence.

Offline flow

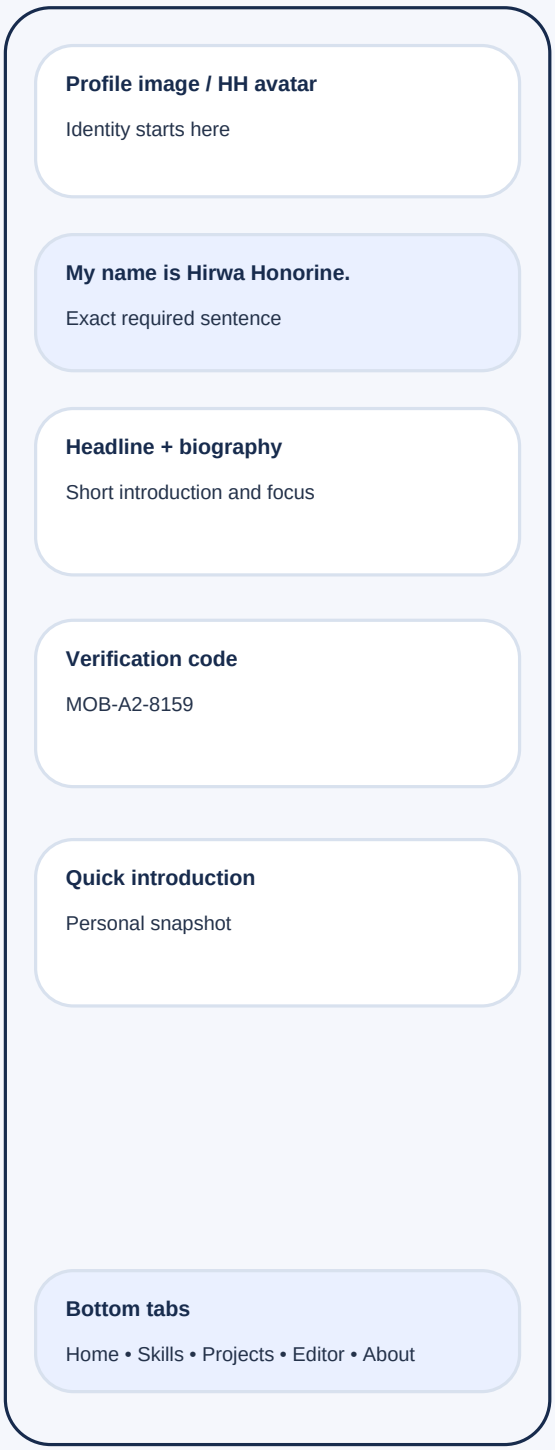
The profile screens and saved data are local. Test by enabling Airplane Mode, closing the app, reopening it and checking tabs, project details and saved profile. Any future optional web link must be labelled as requiring a connection.

Navigation decision

The five main sections stay reachable through the bottom tab bar. Project Details is nested within the Projects tab so Android Back returns to the project list and keeps the user in the same tab.

Annotated wireframes: Home and Skills

Conceptual wireframes to compare with the final implementation



Home annotations

1. The required identity sentence is prominent near the top.
2. The profile image is either a selected photo or HH initials.
3. The headline and biography introduce me without claiming expert-level skills.
4. The verification code is visible for the assessor.

Skills annotations

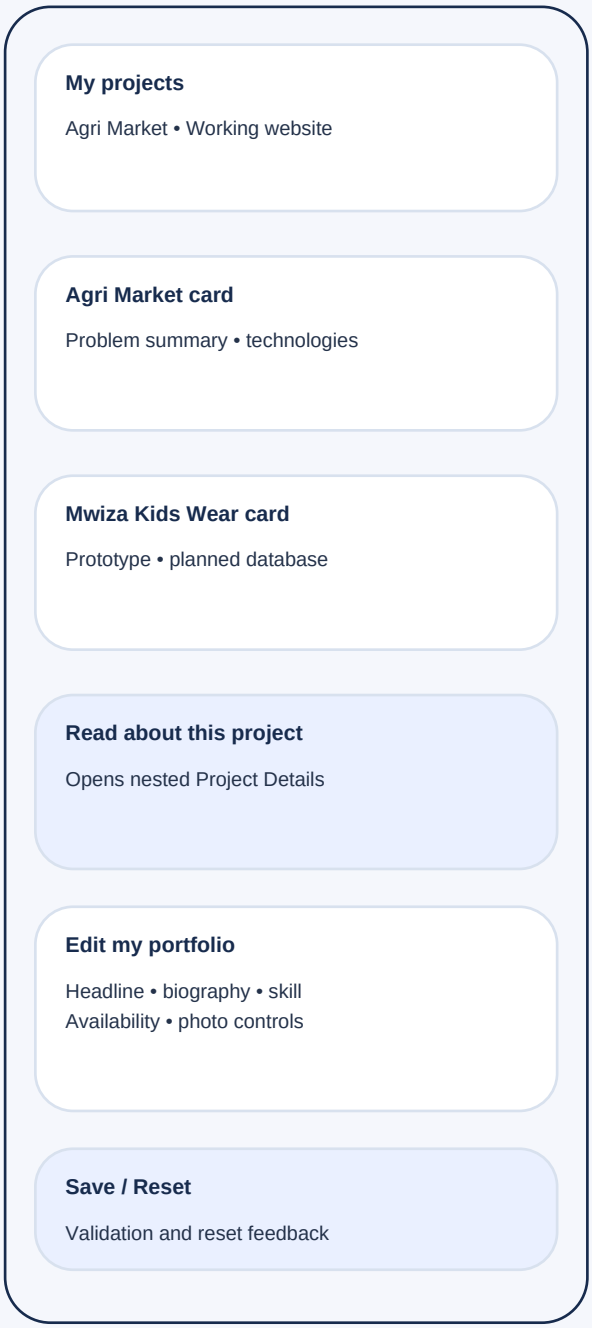
The Skills screen uses reusable cards for HTML, CSS, JavaScript, MySQL and Basic Website Prototyping. The descriptions explain how I have used each skill and are phrased as learning experience, not expert claims.

Education content

Computer Science / Software Engineering at INES-Ruhengeri. The timeline stays concise and does not invent dates or qualifications not provided.

Annotated wireframes: Projects and Editor

Project detail flow, personal contribution and form validation



Project card and detail content

Each project shows its problem or purpose, my contribution, technologies and current status. Agri Market describes my idea, first prototype, AI-assisted development, code review/edits and connected MySQL. Mwiza Kids Wear is labelled as a prototype; its MySQL connection is not yet made.

Editor fields

Controlled fields: My headline; A little about me; Skill I want to highlight; availability switch. Photo controls: take a photo, choose from phone, preview, replace and remove. Feedback explains permission denial or cancellation.

Validation and reset

Headline must contain at least 5 non-space characters. Biography must contain at least 20. Primary skill must contain at least 2. Invalid input blocks saving and displays a field-level message. Reset requires confirmation and restores the default profile.

Navigation note

Project Details belongs to a nested stack inside Projects. Android Back returns to the Projects list, rather than leaving the Projects tab.

Visual and accessibility decisions

Design choices and implementation checks

Color palette

Navy #172B4D	**Blue** #356AE6	**Background** #F5F7FC
White #FFFFFF	**Body text** #24324A	**Success** #167D58

Typography and spacing

Use a clear hierarchy: 22-point section headings, 15–17-point card titles, and body text around 14 points in the app. Use scalable React Native text units, consistent card spacing, rounded containers and generous touch padding. Test with increased Android font size.

Accessibility and feedback

Inputs have visible labels and accessibility labels. Buttons use button roles. Error states include text, not only color. Scrollable layouts support narrow screens; controls should remain reachable with larger text. Confirm focus, touch targets and contrast on the target device.

Offline and data use

The portfolio profile is stored locally with AsyncStorage. No password, token or sensitive record is required. Airplane Mode testing must confirm the core screens still work and the saved profile restores after restart.

Implementation comparison status

This document describes the intended layout and must be compared with screenshots from the final installed APK before submission. Add real screenshots and explain any justified differences only after the APK is built and tested. No physical-device results are claimed in this design document.
